DETAILED ACTION

Claims 1-3 are pending as originally filed

Claim Rejections - 35 USC § 103

Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over WO 02/051528, or Schmidt (US 6,352,641).

WO teaches low pressure drop spiral wound modules for applications such as reverse osmosis or ultrafiltration as claimed – see example 5.

Schmidt teaches a spiral wound element as seen in the figures and column 1 lines 8-38. Figure 2 of Schmidt also shows multiple wraps of the permeate spacer material around the core as claimed.

The references do not specifically teach that the effective perforation area (area of perforations multiplied by the open area of one round of permeate spacer around the core) is at least equal to the cross-sectional area of the tube. However, this factor can be optimized for lowest pressure-drop without compromising the strength of the core tube. Discovery of an optimum value of a result effective variable in a known process is ordinarily within the skill of the art. In re Boesch and Slaney, 205 USPQ 215 (CCPA 1980); In re Antonie, 559 F.2d 618, 195 USPQ 6 (CCPA 1977); “[W]here the general conditions of a claim are disclosed in the prior art, it is not inventive to discover the optimum or workable ranges by routine experimentation.” In re Aller, 220 F.2d 454, 456, 105 USPQ 233, 235 (CCPA 1955). This factor is also commonly used in designing perforated tubes or cores, as seen in the reference Haq et al (US 6,702,941) (column

Art Unit: 1723

26, lines 34-55, which teaches that perforated area should be at least equal to the cross-sectional area of the inlet tube to avoid perforations restricting the flow).
